Othello (a.k.a. reversi)

- 8x8 board of cells
- The tokens have two sides: one black, one white
- One player is putting the white side and the other player is putting the black side
- The game starts like this:

- The game proceeds by each side putting a piece of his own color
- The winner is the one who gets more pieces of his color at the end of the game
- Below, white wins by 28

- When a black token is put onto the board, and on the same horizontal, vertical, or diagonal line there is another black piece such that every piece between the two black tokens is white, then all the white pieces are flipped to black
- Below there are 17 possible moves for white

• A move can only be made if it causes flipping of pieces. A player can pass a move iff there is no move that causes flipping. The game ends when neither player can make a move

• the snapshots are from <u>www.mathewdoucette.com/artificialintelligence</u>

• the description is from home.kkto.org:9673/courses/ai-xhtml

AAAI has a nice repository: <u>www.aaai.org</u>
Click on AI topics, then select "games & puzzles" from the menu

- Hexagonal cells are arranged as below . Common sizes are 10x10, 11x11, 14x14, 19x19.
- The game has two players: Black and White
- Black always starts (there is also a swapping rule)
- Players take turns placing their pieces on the board

• The object of the game is to make an uninterrupted connection of your pieces from one end of your board to the other

- Other properties
 - First player always wins
 - No ties

Hex

- Invented independently by Piet Hein in 1942 and John Nash in 1948.
- Every empty cell is a legal move, thus the game tree is wide b = ~80 (chess b = ~35, go b = ~250)
- Determining the winner (assuming perfect play) in an arbitrary Hex position is PSPACEcomplete [Rei81].
- How to get knowledge about the "potential" of a given position without massive gametree search?

- There are good programs that play with heuristics to evaluate game configurations

Go is a two-player game played using black and white stones on a board with 19x19, 13x13, or 9x9 intersections.

Players take turns placing stones onto the intersections. Goal: surround the most territory (empty intersections).

Once placed onto the board, stones are not moved.

A **block** is a set of adjacent stones (up, down, left, right) of the same color.

A **block** is a set of adjacent stones (up, down, left, right) of the same color.

A **liberty** of a block is an empty intersection adjacent to one of its stones.

If a block runs out of liberties, it is captured. Captured blocks are removed from the board.

If a block runs out of liberties, it is captured. Captured blocks are removed from the board.

If a block runs out of liberties, it is captured. Captured blocks are removed from the board.

The game ends when neither player wishes to add more stones to the board.

The player with the most enclosed territory wins the game. (With *komi*, White wins this game by 7.5 pts.)

White can capture by playing at A or B. Black can capture by playing at C. Black can't play at D and E simultaneously.

Example on 13x13 Board

What territory belongs to White? To Black?

Example on 13x13 Board

Black ahead by 1 point. With *komi*, White wins by 4.5 pts.

Much higher search requirements

- Minimax game tree has O(b^d) positions
- In chess, b = ~35 and d = ~100 half-moves
- In Go, b = ~250 and d = ~200 half-moves
- However, 9x9 Go seems almost as hard as 19x19

Accurate evaluation functions are difficult to build and computationally expensive

- In chess, material difference alone works fairly well
- In Go, only 1 piece type with no easily extracted features

Determining the winner from an arbitrary position is PSPACE-hard (Lichtenstein and Sipser, 1980)

Many Faces of Go v.11 (Fotland), Go4++ (Reiss), Handtalk/Goemate (Chen), GNUGo (many), etc.

Each consists of a carefully crafted combination of pattern matchers, expert rules, and selective search

Playing style of current programs:

- Focus on safe territories and large frameworks
- Avoid complicated fighting situations

Rank is about 6 kyu, though actual playing strength varies from opening (stronger) to middle game (much weaker) to endgame (stronger)
